## Papers

Identifying Relations for Open Information Extraction (Fader et al., 2011)

LODifier: Generating Linked Data from Unstructured Text  
(Augenstein et al., 2012)

# Strukturierung

- 1 Introduction to Information Extraction
- 2 OIE - Principles
- 3 Example: LODifier
- 4 Conclusion

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooo  
oooo

# Introduction to Information Extraction

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooo

# What is Information Extraction?

## Information Extraction

Goal of Information Extraction is automatically extracting information from unseen text

*Information:* entities, relations, events...

To make the dough for a good pizza, we start with putting 1kg of flour into the mixing bowl.  
*(1kg of flour, put into, mixing bowl)*

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooo  
oooo

# Problems of Information Extraction

- Named Entity Recognition
- Relationship Extraction
- Coreference Resolution
- Comment Extraction
- many more..

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooo  
oooooo  
oooooo  
oooo  
oooo

# OIE - Principles

●○○  
○○○○○○○○○○○○○○  
○○○○○○○○○

○○○○  
○○○○○○○○  
○○○○○  
○○○○○  
○○○○○  
○○○○

# OIE - Principles

## Open Information Extraction

# Open Information Extraction

*IE*: Extractor for each target relation

*Open*: No pre-specified extractors

Unsupervised learning of relation phrases

Extraction of information on every given domain

# Problems of Open Information Extraction

## ■ Incoherent extractions:

This guide contains dead links and omits sites  
*contains omits*

## ■ Uninformative extractions:

Faust made a deal with the devil  
*(Faust, made, a deal)*

○○○  
●○○○○○○○○○○○○○  
○○○○○○○○○

○○○○  
○○○○○○○○○  
○○○○○  
○○○○○  
○○○○○  
○○○○

# OIE - Principles

## Methods

○○○  
●○○○○○○○○○○○○○  
○○○○○○○○○

○○○○  
○○○○○○○○○  
○○○○○  
○○○○○  
○○○○

# Text Runner and WOE

- 1 *Label*: Automatic sentence labeling by heuristics
- 2 *Learn*: A relation phrase extractor is learned
- 3 *Extract*: Identifying NP pairs and searching relations words between

○○○  
○○●○○○○○○○○○○  
○○○○○○○○○

○○○○  
○○○○○○○○  
○○○○○  
○○○○○  
○○○○○  
○○○○

# Problems

- Large number of labeled training examples required
- Alternative heuristic labeling leads to huge noise and stacked uncertainty
- Ignores both holistic and lexical aspects

```

ooo
ooo●oooooooooooo
oooooooooooo

```

```

oooo
oooooooooooo
oooooo
oooooo
oooooo
oooo

```

## Methods

# Syntactic constraint

- Limits relations to those matching a certain POS Tag pattern:
- $V \mid VP \mid VW^*P$
- Always chooses longest possible match
- Merge adjacent matches together

$$V \mid VP \mid VW^*P$$

$V$  = verb particle? adv?  
 $W$  = (noun | adj | adv | pron | det)  
 $P$  = (prep | particle | inf. marker)

ooo  
oooo●oooooooo  
ooooooooo

oooo  
ooooooooo  
ooooo  
ooooo  
ooooo  
oooo

# Lexical constraint

- Only assume relations that appear in the corpus for a certain amount
- The Obama administration is **offering only modest greenhouse gas reduction targets** at the conference

```

○○○
○○○○○●○○○○○○○
○○○○○○○○○

```

```

○○○
○○○○○○○○○
○○○○○
○○○○○
○○○

```

## Methods

# Limitations of those constraints

- In a set of 300 hand-annotated sentences 85% relations fell into those constraints
- Model is not complete and has its flaws

Binary Verbal Relation Phrases	
85%	Satisfy Constraints
8%	Non-Contiguous Phrase Structure Coordination: X <u>is produced</u> and maintained <u>by</u> Y Multiple Args: X <u>was founded</u> in 1995 <u>by</u> Y Phrasal Verbs: X <u>turned</u> Y <u>off</u>
4%	Relation Phrase Not Between Arguments Intro. Phrases: <u>Discovered by</u> Y, X ... Relative Clauses: ... the Y that X <u>discovered</u>
3%	Do Not Match POS Pattern Interrupting Modifiers: X <u>has a lot of faith in</u> Y Infinitives: X <u>to attack</u> Y

# ReVerb Extraction Algorithm

- *Relation Extraction*: Find the longest possible string of words that match the relation constraints, merge adjacents
- *Argument Extraction*: Find the nearest NP left and right to the relation that is not a relativ pronoun, WHO-adverb or existential-there.
- How is the lexical constraint being checked? By creating a list of relational phrases by applying this algorithm on a 500 million Web sentences.

ooo  
oooooooo●ooooo  
ooooooooo

oooo  
ooooooooo  
ooooo  
ooooo  
ooooo  
oooo

## ReVerb Confidence Function

- The Algorithm has a high recall, but low precision
- Now the extracted relation is weighted by a confidence function:

```

ooo
oooooooooooo●oooo
oooooooooooo

```

```

oooo
oooooooooooo
oooooo
oooooo
oooo
oooo

```

# ReVerb Confidence Function

Weight	Feature
1.16	$(x, r, y)$ covers all words in $s$
0.50	The last preposition in $r$ is <i>for</i>
0.49	The last preposition in $r$ is <i>on</i>
0.46	The last preposition in $r$ is <i>of</i>
0.43	$len(s) \leq 10$ words
0.43	There is a WH-word to the left of $r$
0.42	$r$ matches VW*P from Figure 1
0.39	The last preposition in $r$ is <i>to</i>
0.25	The last preposition in $r$ is <i>in</i>
0.23	$10 \text{ words} < len(s) \leq 20 \text{ words}$
0.21	$s$ begins with $x$
0.16	$y$ is a proper noun
0.01	$x$ is a proper noun
-0.30	There is an NP to the left of $x$ in $s$
-0.43	$20 \text{ words} < len(s)$
-0.61	$r$ matches V from Figure 1
-0.65	There is a preposition to the left of $x$ in $s$
-0.81	There is an NP to the right of $u$ in $s$

```

○○○
○○○○○○○○○○●○○○
○○○○○○○○○○

```

```

○○○○
○○○○○○○○
○○○○○○
○○○○○○
○○○○○○
○○○○

```

# Evaluation

Better results than TextRunner through lexical features, but still low recall.

```

ooo
oooooooooooooooo●ooo
oooooooooooo

```

```

oooo
ooooooooooo
oooooo
oooooo
oooooo
oooo

```

## Methods

## Why?

Argument extraction is open to improvements

## Methods

## Why?

## Evaluating the evaluation:

**REVERB - Incorrect Extractions**

65%	Correct relation phrase, incorrect arguments
16%	N-ary relation
8%	Non-contiguous relation phrase
2%	Imperative verb
2%	Overspecified relation phrase
7%	Other, including POS/chunking errors

**REVERB - Missed Extractions**

52%	Could not identify correct arguments
23%	Relation filtered out by lexical constraint
17%	Identified a more specific relation
8%	POS/chunking error

ooo  
ooooo  
oooooooooooo●  
ooooooooo

oooo  
ooooo  
ooooooooo  
ooooo  
ooooo  
ooooo

# Conclusion

Acceptable results on easy sentences. Fails on more complex sentences. *Possible improvements:*

- Does not support n-ary relations
- Relations seem overly specific in many results
- Coordination is not in all cases correctly recognized
- Coreference is not predetected by the system

○○○  
○○○○○○○○○○○○○○○  
●○○○○○○○○

○○○○  
○○○○○○○○○  
○○○○○  
○○○○○  
○○○○

# OIE - Principles

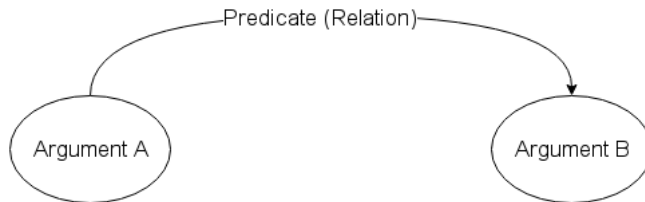

## Data Representation

ooo  
oooooooooooooooo  
o●oooooooo

oooo  
oooooooooo  
oooooo  
ooooo  
oooo

# Standard Patterns

**Argument A** is in a directed relation to **Argument B**.

ooo  
oooooooooooooooo  
oo●oooooooo

oooo  
oooooooooo  
ooooo  
ooooo  
ooooo  
oooo

# Unnormalized Annotation

(argument\_a, predicate\_x, argument\_b)  
(argument\_a, predicate\_y, argument\_c)  
(argument\_a, predicate\_y, argument\_d)

## Problems

- redundant
- unnormalized
- can only produce binary predicates

```
ooo
ooooo
ooooooooooooo
ooo●ooooo
```

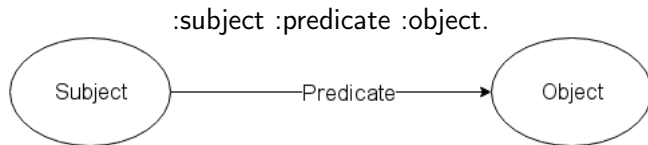

```
oooo
ooooo
ooooooooo
ooooo
ooooo
ooooo
oooo
```

# RDF and Linked Data

## Resource Description Framework

Models propositions by constructing *triples* including **Subjects**, **Objects** and **Predicates**

Generates a directed graph

# RDF Concepts and Notation

- **URIs**  
identifies resources (S, R, O) distinctively and references further informations (triples)
- **Conclusions**  
allows to draw conclusions using rules
- **Turtle**  
allows syntax abbreviations
- **Blanknodes**  
placeholder for something without a URI
- **Queries**  
can be searched by querying (eg SPARQL)

ooo  
oooooooooooooooo  
oooo●ooo

oooo  
oooooooooo  
ooooo  
ooooo  
ooooo  
oooo

# RDF Reification

**Motivation:** How can I realize embedded propositions?

**Example:** Peter said, he watched the movie.

```

ooo
oooooooooooooooo
oooo●ooo

```

```

oooo
oooooooooo
ooooo
ooooo
ooooo
oooo

```

# RDF Reification

**Motivation:** How can I realize embedded propositions?

**Example:** Peter said, he watched the movie.

**Wrong proposition**

:Peter :watched :movie

ooo  
oooooooooooooooo  
oooo●ooo

oooo  
oooooooo  
ooooo  
ooooo  
ooooo  
oooo

# RDF Reification

**Motivation:** How can I realize embedded propositions?

**Example:** Peter said, he watched the movie.

## Reification

```
:Peter :said __:prop.  
__:prop rdf:subject :Peter.  
__:prop rdf:predicate :watched.  
__:prop rdf:object :movie.
```

ooo  
oooooooooooooooo  
oooooooo●oo

oooo  
oooooooooo  
ooooo  
ooooo  
ooooo  
oooo

# Vocabularies & Ontologies

Several vocabularies provide useful relations and functionality, eg.:

- RDF (rdf:type, ...)
- RDFS (rdfs:subClassOf, rdfs:domain, rdfs:range, ...)
- OWL (owl:sameAs, owl:SymmetricProperty, ...)
- FOAF

Ontologies are huge RDF Graphs containing many triples, eg.:

- DBpedia
- Wikidata
- WordNet

```

ooo
oooooooooooooooo
oooooooo●o

```

```

oooo
oooooooooo
oooooo
ooooo
ooooo
oooo

```

# RDF Syntax

```

dbr:Barack_Obama a foaf:person, :President;
    dbo:spouse dbr:Michelle_Obama.
dbr:Bernie_Sanders dbo:birthPlace dbr:New_York,
                                dbr:Brooklyn;
dbr:Brooklyn dbo:isPartOf dbr:New_York

```

ooo  
oooooooooooooooo  
ooooooooo●

oooo  
oooooooooo

# LODifier: Generating Linked Data from Unstructured Text (Augenstein et al., 2012)

Generate an RDF Graph from unstructured Text

**Past Approaches:** Use Patterns to trade recall for precision

**LODifier:** Process the entire text

ooo  
oooooooooooooooo  
oooooooooooo

●ooo  
oooooooooo  
oooooo  
ooooo  
oooo  
oooo

## Example: LODifier Architecture

```

ooo
oooooooooooooooo
oooooooooooo

```

```

o●oo
oooooooooo
oooooo
oooooo
oooo

```

## Architecture

## Architecture

(Augenstein et al., 2012)

ooo  
oooooooooooooooo  
oooooooooooo

oo●o  
oooooooo  
ooooo  
ooooo  
oooo

# Approach

- 1 **Parse** the input text (POS, Treetagging, NER)
- 2 Apply **Deep Semantic Analysis** to get relations
- 3 Enrich NEs and words with **URIs** (DBpedia and WordNet)
- 4 Forge an **RDF Graph** of this information

ooo  
oooooooooooooooo  
oooooooooooo

ooo●  
oooooooooooo  
oooooo  
oooooo  
oooooo  
oooo

## Architecture

# How does it happen?

Lets go through the process step-by-step!

## Example Text:

The New York Times reported that John McCarthy died. He invented the programming language LISP.

example taken from Augenstein et al., 2012

# Parsing Syntax - C&C

## C&C Parser

Syntactical Parser that tags POS and builds Parse Trees in CCG.

## Combinatory Categorical Grammar (CCG)

Grammatical formalism allows parallel analysis of syntax and semantics

Associates words with categories that can be combined (rule-based) to form a sentence

Syntax via Category Combination, Semantics via lambda calculus

```

ooo

# Assign WordNet URIs

## RDF WordNet

**WN:** Lexicography containing senses linked by semantic relations

**RDF WN:** LD Representation of WN providing URIs for words

### Steps:

- 1 Lemmatization
- 2 WSD (UKB)
- 3 Assign RDF WN URIs to word senses

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
ooooooooo●  
ooooo  
ooooo  
ooooo  
oooo

## Preprocessing

# Preprocessing Result

**We now have ...**

- URIs for all NEs
- URIs for all (disambiguated) words
- Relations between entities (those URIs)

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
●oooo  
ooooo  
oooo

## Example: LODifier

# RDF Construction

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
o●oooo  
oooooo  
oooo

## RDF Construction

# What now?

Let's now construct the RDF Graph from this information!

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oo●ooo  
ooooo  
oooo

# Namespaces/Vocabularies

LODifier introduces several namespaces:

- **drsclass**: contains Boxer classes (event, person, ...) and :named relation
- **drsrel**: contains Boxer relations (agent, patient, ...)
- **ne**: contains the named entity URLs
- **reify**: reification (embedding propositions into propositions)

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oo●ooo  
ooooo  
oooo

# Namespaces/Vocabularies

And uses standard namespaces:

- **rdf:** mainly for rdf:type and reification
- **owl:** for owl:sameAs

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
ooo●ooo  
ooooo  
oooo

# Namespaces/Vocabularies

Finally the two ontologies:

- **wn30**: contains all WordNet URIs
- **dbpedia**: contains the dbpedia URIs
- **class**: contains classes not in wn30 nor in dbpedia

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
ooo●ooo  
ooooo  
oooo

# RDF Construction Strategy I

Create a blanknode `_:x` for each discourse referent (`x0, x1, ...`)

# RDF Construction Strategy II

# RDF Construction Strategy III

if NE, then create

`_:x drsclass:named ne:URI`

## RDF Construction

## RDF Construction Strategy IV

# RDF Construction Strategy V

if NE and DBpedia URI exists create  
\_\_ :x owl:sameAs dbpedia:URI

## RDF Construction

## RDF Construction Strategy VI

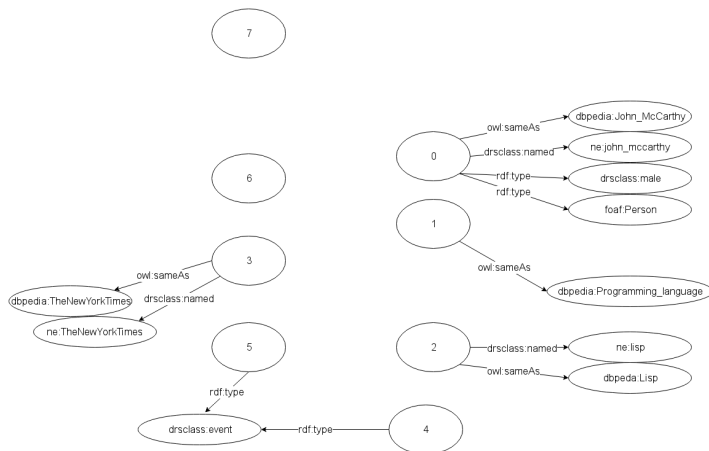

# RDF Construction Strategy VII

via `rdf:type` assign closed classes (event, person, ...)  
`_:x rdf:type drsclass:CLOSEDCLASS`

## RDF Construction

## RDF Construction Strategy VIII

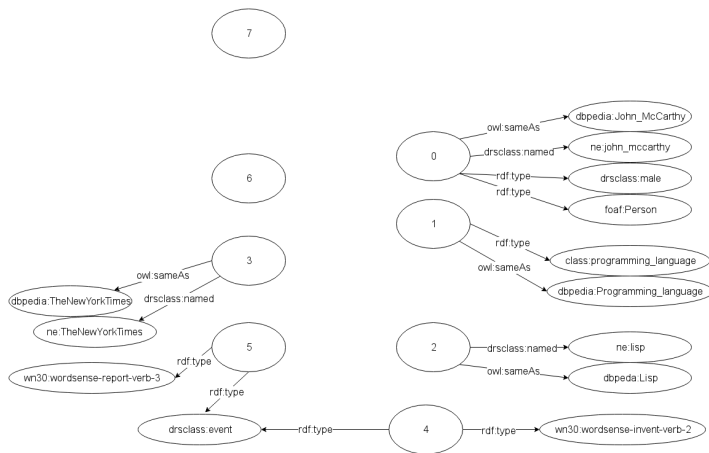

# RDF Construction Strategy IX

via `rdf:type` assign open classes (die, programming\_language, ...)  
`_:x rdf:type wn30:OPENCLASS, class:OPENCLASS`

## RDF Construction

## RDF Construction Strategy X

# RDF Construction Strategy XI

create triples from binary relations (agent, theme, ...)

`_:x drsrel:RELATION _:y`

## RDF Construction

## RDF Construction Strategy XII

# RDF Construction Strategy XIII

recursive reification of embedded propositions (eg. by *report* or *says*)

## RDF Construction

## RDF Construction Strategy XIV

```

## Example: LODifier Experiments

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
o●oooo  
oooo

# Method

- Evaluate by testing similarity of two given documents:
- *the problem of deciding whether two randomly selected stories discuss the same news topic*
- TDT-2 benchmark dataset: 84.000 news documents
- Extract 183 positive and 183 negative pairs (avg. 11.2 per topic)
- Calculate similarity and evaluate the system on the result

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oo●ooo  
oooo

## Similarity measurements

- 1 NEs identified by Wikifier and successfully disambiguated words in UKB
- 2 add NEs recognized by Boxer
- 3 add URIs of unrecognized words

*Further add structural features:* Measurement of the similarity of the RDF graphs of the two documents

```

○○○
○○○○○○○○○○○○○○
○○○○○○○○○○
○○○○○○○○○

```

```

○○○○
○○○○○○○○
○○○○○○
○○○○○
○○○●○
○○○○

```

## Experiments

## Accuracy

Table 1. Accuracy on Story Link Detection Task

Model	normal extended	
<b>Similarity measures without structural knowledge</b>		
Random Baseline	50.0	–
Bag of Words	63.0	–
Bag of URIs (Variant 1)	61.6	75.1
Bag of URIs (Variant 2)	70.6	76.0
Bag of URIs (Variant 3)	<b>73.4</b>	<b>76.4</b>
<b>Similarity measures with structural knowledge</b>		
proSim <sub>cut</sub> (k=6, Variant 1)	79.0	78.9
proSim <sub>cut</sub> (k=6, Variant 2)	80.3	80.3
proSim <sub>cut</sub> (k=6, Variant 3)	81.6	81.6
proSim <sub>cut</sub> (k=8, Variant 1)	77.7	77.6
proSim <sub>cut</sub> (k=8, Variant 2)	79.2	79.0
proSim <sub>cut</sub> (k=8, Variant 3)	<b>82.1</b>	<b>81.9</b>
proSim <sub>len</sub> (k=6, Variant 3)	81.5	81.4

# Precision - Recall

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
ooooo  
ooooo  
●ooo

## Example: LODifier

# Conclusions

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooo  
ooooo  
ooooo  
ooooo  
o●ooo

## Conclusions

# What to draw from this?

- deep semantic analysis can work for OIE
- combining several existing NLP Systems provides a well functioning extraction system
- information gained by unsupervised OIE can already improve real world tasks

ooo  
oooooooooooooooo  
oooooooooooo

oooo

oooooo  
ooooo  
ooooo  
oo●oo

# What we liked

- full-text OIE

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooo  
oooooo  
oooooo  
oooooo  
oo●oo

## Conclusions

# What we liked

- full-text OIE
- uses many strengths of RDF

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooo  
oooooo  
oooooo  
oooooo  
oo●oo

## Conclusions

# What we liked

- full-text OIE
- uses many strengths of RDF
- relations aren't overspecified

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooooo  
oo●oo

## Conclusions

# What we liked

- full-text OIE
- uses many strengths of RDF
- relations are not overspecified
- extendable/improvable by improving/swapping Systems in the architecture

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooooo  
oo●oo

## Conclusions

# What we liked

- full-text OIE
- uses many strengths of RDF
- relations are not overspecified
- extendable/improvable by improving/swapping Systems in the architecture
- part of the LOD-Cloud

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooooo  
oo●oo

## Conclusions

# What we liked

- full-text OIE
- uses many strengths of RDF
- relations are not overspecified
- extendable/improvable by improving/swapping Systems in the architecture
- part of the LOD-Cloud
- results in standardized notation

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooooo  
oo●oo

## Conclusions

# What we liked

- full-text OIE
- uses many strengths of RDF
- relations are not overspecified
- extendable/improvable by improving/swapping Systems in the architecture
- part of the LOD-Cloud
- results in standardized notation
- domain-independent

# What we didnt like

- Redundant processes like NER

# What we didnt like

- Redundant processes like NER
- BlankNode Massacre

## Conclusions

# What we didnt like

- Redundant processes like NER
- BlankNode Massacre
- confusing boxer relations not simplified for RDF (will be hard to search through)

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
ooooo  
ooooo  
ooo●

## Conclusions

# What we didnt like

- Redundant processes like NER
- BlankNode Massacre
- confusing boxer relations not simplified for RDF (will be hard to search through)
- Paper scratches only the surface of the system

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooo●

## Conclusions

# What we didnt like

- Redundant processes like NER
- BlankNode Massacre
- confusing boxer relations not simplified for RDF (will be hard to search through)
- Paper scratches only the surface of the system
- Some points are unclear / not even described

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooooo  
oooo

# Conclusion

# Weaknesses and Strengths of OIE

- trades precision for recall

# Weaknesses and Strengths of OIE

- trades precision for recall
- OIE > IE if no sepcial task/domain is defined

# Weaknesses and Strengths of OIE

- trades precision for recall
- $OIE > IE$  if no special task/domain is defined
- theory independent

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooo  
oooooo  
oooooo  
oooooo  
oooo

## Weaknesses and Strengths of OIE

- trades precision for recall
- $OIE > IE$  if no special task/domain is defined
- theory independent
- relations may be redundant/overspecified/unintended

ooo  
oooooooooooooooo  
oooooooooooo

oooo  
oooooooooooo  
oooooo  
oooooo  
oooo

## Weaknesses and Strengths of OIE

- trades precision for recall
- $OIE > IE$  if no special task/domain is defined
- theory independent
- relations may be redundant/overspecified/unintended
- restricted usability of results due to low precision

# Future Opportunities

- better subsystems

# Future Opportunities

- better subsystems
  - Coreference Resolution

# Future Opportunities

- better subsystems
  - Coreference Resolution
  - NER

# Future Opportunities

- better subsystems
  - Coreference Resolution
  - NER
  - Disambiguation

# Future Opportunities

- better subsystems
  - Coreference Resolution
  - NER
  - Disambiguation
- improve semantic analysis
