Introduction to Information Extraction

What is Information Extraction?

Information Extraction

Goal of Information Extraction is automatically extracting information from unseen text

Information: entities, relations, events...

To make the dough for a good pizza, we start with putting 1kg of flour into the mixing bowl.
(1kg of flour, put into, mixing bowl)

ooo
oooooooooooo
oooooooooooo

oooo

oooooooooooo

oooo

oooo

oooo

o

o

o

o

o

OIE - Principles

Open Information Extraction

Open Information Extraction

IE: Extractor for each target relation

Open: No pre-specified extractors

Unsupervised learning of relation phrases

Extraction of information on every given domain

Problems of Open Information Extraction

■ Incoherent extractions:

This guide contains dead links and omits sites
contains omits

■ Uninformative extractions:

Faust made a deal with the devil
(Faust, made, a deal)

○○○○

○○○○

○

○

○

○

○

OIE - Principles

Methods

Text Runner and WOE

- 1. *Label*: Automatic sentence labeling by heuristics
- 2. *Learn*: A relation phrase extractor is learned
- 3. *Extract*: Identifying NP pairs and searching relations words between

Problems

- Large number of labeled training examples required
- Alternative heuristic labeling leads to huge noise and stacked uncertainty
- Ignores both holistic and lexical aspects

```

ooo
ooo●ooooooooo
oooooooooooo

```

```

oooo
oooooooooooo
oooooo
ooooo
oooo
oooo

```

```

o
o

```

```

o
o

```

Methods

Syntactic constraint

- Limits relations to those matching a certain POS Tag pattern:
- $V \mid VP \mid VW^*P$
- Always chooses longest possible match
- Merge adjacent matches together

$$V \mid VP \mid VW^*P$$

V = verb particle? adv?

W = (noun | adj | adv | pron | det)

P = (prep | particle | inf. marker)

Lexical constraint

- Only assume relations that appear in the corpus for a certain amount
- The Obama administration is **offering only modest greenhouse gas reduction targets** at the conference

```

ooo
oooooooo●oooooooo
oooooooooooo

```

```

oooo
oooooooooooo
ooooo
oooo
oooo
oooo

```

```

o
o

```

```

o
o

```

Limitations of those constraints

- In a set of 300 hand-annotated sentences 85% relations fell into those constraints
- Model is not complete and has its flaws

Binary Verbal Relation Phrases	
85%	Satisfy Constraints
8%	Non-Contiguous Phrase Structure Coordination: X <u>is produced</u> and maintained <u>by</u> Y Multiple Args: X <u>was founded</u> in 1995 <u>by</u> Y Phrasal Verbs: X <u>turned</u> Y <u>off</u>
4%	Relation Phrase Not Between Arguments Intro. Phrases: <u>Discovered by</u> Y, X ... Relative Clauses: ... the Y that X <u>discovered</u>
3%	Do Not Match POS Pattern Interrupting Modifiers: X <u>has a lot of faith in</u> Y Infinitives: X <u>to attack</u> Y

```

ooo
oooooooo●ooooo
ooooooooo

```

```

oooo
oooooooooo
ooooo
oooo
oooo

```

```

o
o

```

```

o
o

```

ReVerb Extraction Algorithm

- *Relation Extraction*: Find the longest possible string of words that match the relation constraints, merge adjacents
- *Argument Extraction*: Find the nearest NP left and right to the relation that is not a relativ pronoun, WHO-adverb or existential-there.
- How is the lexical constraint being checked? By creating a list of relational phrases by applying this algorithm on a 500 million Web sentences.

ReVerb Confidence Function

- The Algorithm has a high recall, but low precision
- Now the extracted relation is weighted by a confidence function:

```

○○○
○○○○○○○○●○○○
○○○○○○○○○

```

```

○○○○
○○○○○○○○
○○○○○
○○○○
○○○○
○○○○

```

```

○
○

```

```

○
○

```

ReVerb Confidence Function

Weight	Feature
1.16	(x, r, y) covers all words in s
0.50	The last preposition in r is <i>for</i>
0.49	The last preposition in r is <i>on</i>
0.46	The last preposition in r is <i>of</i>
0.43	$len(s) \leq 10$ words
0.43	There is a WH-word to the left of r
0.42	r matches VW*P from Figure 1
0.39	The last preposition in r is <i>to</i>
0.25	The last preposition in r is <i>in</i>
0.23	$10 \text{ words} < len(s) \leq 20 \text{ words}$
0.21	s begins with x
0.16	y is a proper noun
0.01	x is a proper noun
-0.30	There is an NP to the left of x in s
-0.43	$20 \text{ words} < len(s)$
-0.61	r matches V from Figure 1
-0.65	There is a preposition to the left of x in s
-0.81	There is an NP to the right of u in s

```

ooo
oooooooooooo●oo
oooooooooooo

```

```

oooo
oooooooooo
ooooo
oooo
oooo
oooo

```

```

o
o

```

```

o
o

```

Evaluation

Better results than TextRunner through lexical features, but still low recall.

Methods

Why?

Argument extraction is open to improvements

○○○
 ○○○○○○○○○○●
 ○○○○○○○○

○○○○
 ○○○○○○○○
 ○○○○
 ○○○○
 ○○○○

○
 ○

○
 ○

Why?

Evaluating the evaluation:

REVERB - Incorrect Extractions

65%	Correct relation phrase, incorrect arguments
16%	N-ary relation
8%	Non-contiguous relation phrase
2%	Imperative verb
2%	Overspecified relation phrase
7%	Other, including POS/chunking errors

REVERB - Missed Extractions

52%	Could not identify correct arguments
23%	Relation filtered out by lexical constraint
17%	Identified a more specific relation
8%	POS/chunking error

oooo
oooooooooo
ooooo
oooo
oooo

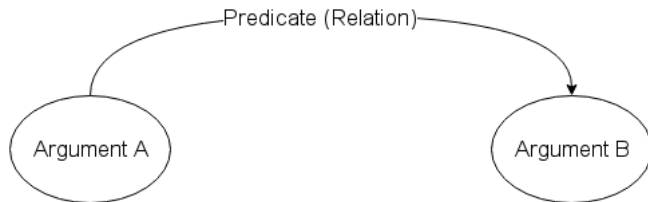

o
o

o
o

OIE - Principles

Data Representation

Standard Patterns

Argument A is in a directed **relation** to **Argument B**.

```

ooo
oooooooooooo
oo●oooooo

```

```

oooo
oooooooooo
ooooo
oooo
oooo

```

```

o
o

```

```

o
o

```

Unnormalized Annotation

```

(argument_a, predicate_x, argument_b)
(argument_a, predicate_y, argument_c)
(argument_a, predicate_y, argument_d)

```

Problems

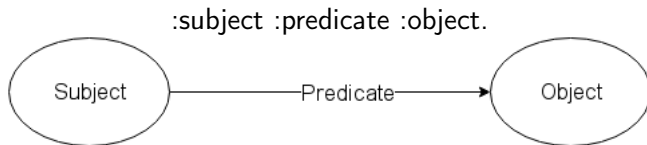

- redundant
- unnormalized
- can only produce binary predicates

RDF and Linked Data

Resource Description Framework

Models propositions by constructing *triples* including **Subjects**, **Objects** and **Predicates**

Generates a directed graph

ooo
ooooooooooooo
oooo●oooo

oooo
oooooooooooo
ooooo
oooo
oooo

o
o
o

o
o
o

RDF Concepts and Notation

- **URIs**
identifies ressources (S, R, O) distinctivly and references further informations (triples)
- **Conclusions**
allows to draw conclusions using rules
- **Turtle**
allows syntax abbreviations
- **Blanknodes**
placeholder for something without a URI
- **Queries**
can be searched by querying (eg SPARQL)

RDF Reification

Motivation: How can I realize embedded propositions?

Example: Peter said, he watched the movie.

```

ooo
oooooooooooooooo
oooooooo●ooo

```

```

oooo
ooooooooooo
ooooo
oooo
oooo

```

```

o
o

```

```

o
o

```

RDF Reification

Motivation: How can I realize embedded propositions?

Example: Peter said, he watched the movie.

Wrong proposition

:Peter :watched :movie

```

ooo
oooooooooooooooo
oooooooo●ooo

```

```

oooo
ooooooooooo
ooooo
oooo
oooo

```

```

o
o

```

```

o
o

```

RDF Reification

Motivation: How can I realize embedded propositions?

Example: Peter said, he watched the movie.

Reification

```

:Peter :said __:prop.
__:prop rdf:subject :Peter.
__:prop rdf:predicate :watched.
__:prop rdf:object :movie.

```

ooo
oooooooooooo
oooooooo●oo

oooo
oooooooooo
ooooo
oooo
oooo

o
o

o
o

Vocabularies & Ontologies

Several vocabularies provide useful relations and functionality, eg.:

- RDF (rdf:type, ...)
- RDFS (rdfs:subClassOf, rdfs:domain, rdfs:range, ...)
- OWL (owl:sameAs, owl:SymmetricProperty, ...)
- FOAF

Ontologies are huge RDF Graphs containing many triples, eg.:

- DBpedia
- Wikidata
- WordNet

ooo
oooooooooooo

LODifier: Generating Linked Data from Unstructured Text (Augenstein et al., 2012)

Generate an RDF Graph from unstructured Text

Past Approaches: Use Patterns to trade recall for precision

LODifier: Process the entire text

Example: LODifier Architecture

○○○
○○○○○○○○○○○○○○
○○○○○○○○○○

●○○○
○○○○○○○○○○
○○○○○○
○○○○
○○○○

○
○

○
○

Architecture

Architecture

Approach

- 1 **Parse** the input text (POS, Treetagging, NER)
- 2 Apply **Deep Semantic Analysis** to get relations
- 3 Enrich NEs and words with **URIs** (DBpedia and WordNet)
- 4 Forge an **RDF Graph** of this information

How does it happen?

Lets go through the process step-by-step!

Example Text:

The New York Times reported that John McCarthy died. He invented the programming language LISP.

example taken from Augenstein et al., 2012

○○●○○

○○○○

○○○○

○

○

○

○

○

Namespaces/Vocabularies

LODifier introduces several namespaces:

- **drsclass**: contains Boxer classes (event, person, ...) and :named relation
- **drsrel**: contains Boxer relations (agent, patient, ...)
- **ne**: contains the named entity URIs
- **reify**: reification (embedding propositions into propositions)

ooo
oooooooooooooooo
oooooooooooo

oooo
oooooooooooo
oo●ooo
oooo
oooo

o
o

o
o

Namespaces/Vocabularies

And uses standard namespaces:

- **rdf:** mainly for `rdf:type` and reification
- **owl:** for `owl:sameAs`

ooo
ooooooooooooo
ooooooooooooo

oooo
ooooooooooooo
oo●ooo
oooo
oooo

o
o

o
o

Namespaces/Vocabularies

Finally the two ontologies:

- **wn30**: contains all WordNet URIs
- **dbpedia**: contains the dbpedia URIs
- **class**: contains classes not in wn30 nor in dbpedia
