Papers

Identifying Relations for Open Information Extraction (Fader et al., 2011)

LODifier: Generating Linked Data from Unstructured Text (Augenstein et al., 2012)

Strukturierung

- 1 Introduction to Information Extraction
- OIE Principles
- 3 Example: LODifier
- 4 Conclusion

Introduction to Information Extraction

What is Information Extraction?

Information Extraction

Goal of Information Extraction is automatically extracting information from unseen text *Information:* entities, relations, events...

To make the dough for a good pizza, we start with putting 1kg of flour into the mixing bowl.

(1kg of flour, put into, mixing bowl)

Problems of Information Extraction

- Named Entity Recognition
- Relationship Extraction
- Coreference Resolution
- Comment Extraction
- many more..

OIE - Principles

OIE - Principles Open Information Extraction

Open Information Extraction

IE: Extractor for each target relation

Open: No pre-specified extractors

Unsupervised learning of relation phrases

Extraction of information on every given domain

Problems of Open Information Extraction

- Incoherent extractions:
 This guide contains dead links and omits sites contains omits
- Uninformative extractions:
 Faust made a deal with the devil (Faust, made, a deal)

OIE - Principles Methods

Text Runner and WOE

- 1 Label: Automatic sentence labeling by heuristics
- Learn: A relation phrase extractor is learned
- **3** Extract: Identifying NP pairs and searching relations words between

Problems

- Large number of labeled training examples required
- Alternative heuristic labeling leads to huge noise and stacked uncertainty
- Ignores both holistic and lexical aspects

Syntactic constraint

- Limits relations to those matching a certain POS Tag pattern:
- V | V P | VW* P
- Always choses longest possible match
- Merge ajacent matches together

$$V \mid VP \mid VW^*P$$
 $V = \text{verb particle? adv?}$
 $W = (\text{noun} \mid \text{adj} \mid \text{adv} \mid \text{pron} \mid \text{det})$
 $P = (\text{prep} \mid \text{particle} \mid \text{inf. marker})$

Lexical constraint

- Only assume relations that appear in the corpus for a certain amount
- The Obama administration is offering only modest greenhouse gas reduction targets at the conference

Limitations of those constraints

- In a set of 300 hand-annotated sentences 85% relations fell into those constraints
- Model is not complete and has its flaws

| | Binary Verbal Relation Phrases |
|-----|---|
| 85% | Satisfy Constraints |
| 8% | Non-Contiguous Phrase Structure |
| | Coordination: X is produced and maintained by Y |
| | Multiple Args: X was founded in 1995 by Y |
| | Phrasal Verbs: X turned Y off |
| 4% | Relation Phrase Not Between Arguments |
| | Intro. Phrases: Discovered by Y, X |
| | Relative Clauses:the Y that X discovered |
| 3% | Do Not Match POS Pattern |
| | Interrupting Modifiers: X has a lot of faith in Y |
| | Infinitives: X to attack Y |

ReVerb Extraction Algorithm

- Relation Extraction: Find the longest possible string of words that match the relation constraints, merge adjacents
- Argument Extraction: Find the nearest NP left and right to the relation that is not a relativ pronoun, WHO-adverb or existential-there.
- How is the lexical constraint being checked? By creating a list of relational phrases by applying this algorithm on a 500 million Web sentences.

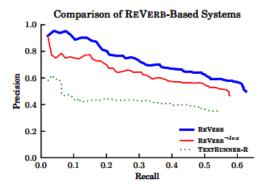

ReVerb Confidence Function

- The Algorithm has a high recall, but low precision
- Now the extracted relation is weighted by a confidence function:

ReVerb Confidence Function

| Weight | Feature |
|--------|--|
| 1.16 | (x, r, y) covers all words in s |
| 0.50 | The last preposition in r is for |
| 0.49 | The last preposition in r is on |
| 0.46 | The last preposition in r is of |
| 0.43 | $len(s) \le 10$ words |
| 0.43 | There is a WH-word to the left of r |
| 0.42 | r matches VW*P from Figure 1 |
| 0.39 | The last preposition in r is to |
| 0.25 | The last preposition in r is in |
| 0.23 | $10 \text{ words} < len(s) \le 20 \text{ words}$ |
| 0.21 | s begins with x |
| 0.16 | y is a proper noun |
| 0.01 | x is a proper noun |
| -0.30 | There is an NP to the left of x in s |
| -0.43 | 20 words < len(s) |
| -0.61 | r matches V from Figure 1 |
| -0.65 | There is a preposition to the left of x in s |
| -0.81 | There is an NP to the right of u in s |

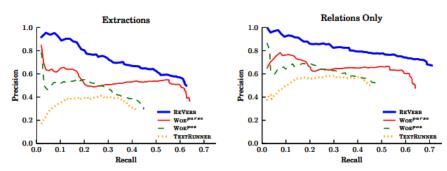

Evaluation

Better results than TextRunner through lexical features, but still low recall.

Why?

Argument extraction is open to improvements

Why?

Evaluating the evaluation:

| | REVERB - Incorrect Extractions |) [| | R |
|-----|--|-----|-----|-----|
| 65% | Correct relation phrase, incorrect arguments | ii | 52% | Co |
| 16% | N-ary relation | Н | 23% | Re |
| 8% | Non-contiguous relation phrase | П | 17% | Ide |
| 2% | Imperative verb | H | 8% | PO |
| 2% | Overspecified relation phrase | Ι, | | |
| 7% | Other, including POS/chunking errors | | | |

| dation. | | |
|---------|---|--|
| | REVERB - Missed Extractions | |
| 2% | Could not identify correct arguments | |
| 3% | Relation filtered out by lexical constraint | |
| 7% | Identified a more specific relation | |
| 8% | POS/chunking error | |

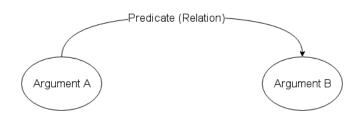

Conclusion

Acceptable results on easy sentences. Fails on more complex sentences. *Possible improvements:*

- Does not support n-ary relations
- Relations seem overly specific in many results
- Coordination is not in all cases correctly recognized
- Coreference is not predetected by the system

OIE - Principles Data Representation

Standard Patterns

Argument A is in a directed relation to Argument B.

Unnormalized Annotation

```
(argument_a, predicate_x, argument_b)
(argument_a, predicate_y, argument_c)
(argument_a, predicate_y, argument_d)
```

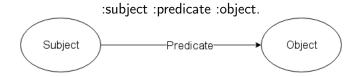

Problems

- redundant
- unnormalized
- can only produce binary predicates

RDF and Linked Data

Resource Description Framework

Models propositions by constructing *triples* including **Subjects**, **Objects** and **Predicates**Generates a directed graph

RDF Concepts and Notation

- URIs
 - identifies ressources (S, R, O) distinctivly and references further informations (triples)
- Conclusions allows to draw conclusions using rules
- Turtle allows syntax abbreviations
- Blanknodes placeholder for something without a URI
- Queries can be searched by querying (eg SPARQL)

RDF Reification

Motivation: How can I realize embedded propositions?

Example: Peter said, he watched the movie.

RDF Reification

Motivation: How can I realize embedded propositions?

Example: Peter said, he watched the movie.

Wrong proposition

:Peter :watched :movie

RDF Reification

Motivation: How can I realize embedded propositions?

Example: Peter said, he watched the movie.

Reification

```
:Peter :said :prop.
:prop rdf:subject :Peter.
:prop rdf:predicate :watched.
:prop rdf:object :movie.
```

Vocabularies & Ontologies

Several vocabularies provide useful relations and functionality, eg.:

- RDF (rdf:type, ...)
- RDFS (rdfs:subClassOf, rdfs:domain, rdfs:range, ...)
- OWL (owl:sameAs, owl:SymmetricProperty, ...)
- FOAF

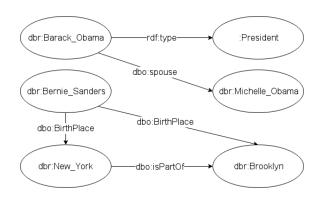

Ontologies are huge RDF Graphs containing many triples, eg.:

- DBpedia
- Wikidata
- WordNet

RDF Syntax

```
dbr:Barack_Obama a foaf:person, :President;
    dbo:spouse dbr:Michelle_Obama.
dbr:Bernie_Sanders dbo:birthPlace dbr:New_York,
                                  dbr:Brooklyn;
dbr:Brooklyn dbo:isPartOf dbr:New_York
```

... as Graph

Example: LODifier

LODifier: Generating Linked Data from Unstructured Text (Augenstein et al., 2012

Generate an RDF Graph from unstructured Text

Past Approaches: Use Patterns to trade recall for precision LODifier: Process the entire text

Conclusion

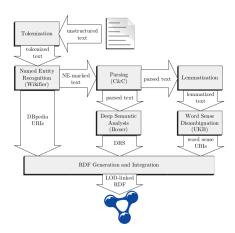

Architecture

Example: LODifier Architecture

Architecture

Architecture

Architecture

Approach

- Parse the input text (POS, Treetagging, NER)
- Apply Deep Semantic Analysis to get relations
- 3 Enrich NEs and words with URIs (DBpedia and WordNet)
- 4 Forge an RDF Graph of this information

Architecture

How does it happen?

Lets go through the process step-by-step!

Example Text:

The New York Times reported that John McCarthy died. He invented the programming language LISP.

example taken from Augenstein et al., 2012

Example: LODifier

Preprocessing

Example: LODifier Preprocessing

Named Entity Recognition - Wikifier

Wikifier

Recognizes NE and replaces them with the Wikipedia Page Link Disambiguates by comparing links between pages.

Example Text Output:

[The New York Times] reported that [John McCarthy (computer scientist)|John McCarthy] died. He invented the [Programming language|programming language] [Lisp (programming language)|LISP].

Example: LODifier

Preprocessing

Parsing Syntax - C&C

C&C Parser

Syntactical Parser that tags POS and builds Parse Trees in CCG.

Combinatory Categorial Grammar (CCG)

Grammatical formalism allows parallel analysis of syntax and semantics

Associates words with categories that can be combined (rule-based) to form a sentence

Syntax via Category Combination, Semantics via lambda calculus

Parsing - Output

```
ccg(1, rp(s:dcl,
    ba(s:dcl.
     lx(np. n.
        t(n, 'The_New_York_Times', 'The_New_York_Times', 'NNS', 'I-NP', '0')),
     fa(s:dcl\np.
        t((s:dcl\np)/s:em, 'reported', 'report', 'VBD', 'I-VP', 'O'),
        fa(s:em.
          t(s:em/s:dcl, 'that', 'that', 'IN', 'I-SBAR', '0'),
          ba(s:dcl.
           lx(np, n,
             t(n, 'John_McCarthy', 'John_McCarthy', 'NNP', 'I-NP', 'I-PER')),
           t(s:dcl\np, 'died', 'die', 'VBD', 'I-VP', '0'))))),
    t(period, '.', '.', '.', '0', '0'))).
ccg(2, rp(s:dcl,
    ba(s:dcl.
      t(np, 'He', 'he', 'PRP', 'I-NP', 'O'),
     fa(s:dcl\np,
        t((s:dcl\np)/np, 'invented', 'invent', 'VBD', 'I-VP', '0'),
       fa(np:nb.
          t(np:nb/n, 'the', 'the', 'DT', 'I-NP', '0'),
         fa(n.
            t(n/n, 'programming_language', 'programming_language', 'NN', 'I-NP', '0'),
            t(n, 'LISP', 'LISP', 'NNP', 'I-NP', '0')))),
    t(period, '.', '.', '.', '0', '0'))).
```

DIE - Principles 000 0000000000000000 Conclusion

Preprocessing

Find Relations - Boxer

Boxer

Creates DRSs from C&C Output

Find Relations - Boxer

Boxer

Creates DRSs from C&C Output

Discours Representation Structure (DRS)

Represents the discourse via *relations* between *entities* Allows referencing over the entire discourse

Example: LODifier 00000000

Find Relations - Boxer

Boxer

Creates DRSs from C&C Output

Discours Representation Structure (DRS)

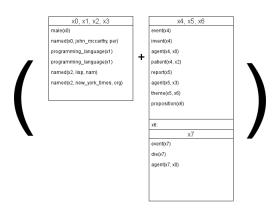

Represents the discourse via relations between entities Allows referencing over the entire discourse

Boxers DRS Relations (Conditions):

- Unary Relations (Classes): eg. topic, person, event, male, ... + all verbs
- Binary Relations: agent, patient, ... (semantic roles)

Boxer Output

Assign WordNet URIs

RDF WordNet

WN: Lexicography containing senses linked by semantic relations RDF WN: LD Representation of WN providing URIs for words

Steps:

- Lemmatization
- WSD (UKB)
- 3 Assign RDF WN URIs to word senses

Preprocessing Result

We now have ...

- URIs for all NEs
- URIs for all (disambiguated) words
- Relations between entities (those URIs)

DIE - Principles 000 00000000000000 Conclusion

RDF Construction

Example: LODifier RDF Construction

What now?

Let's now construct the RDF Graph from this information!

Namespaces/Vocabularies

LODifier introduces several namepaces:

- drsclass: contains Boxer classes (event, person, ...) and :named relation
- drsrel: contains Boxer relations (agent, patient, ...)
- ne: contains the named entity URIs
- reify: reification (embedding propositions into propositions)

Namespaces/Vocabularies

And uses standard namespaces:

- rdf: mainly for rdf:type and reification
- owl: for owl:sameAs

Namespaces/Vocabularies

Finally the two ontologies:

- wn30: contains all WordNet URIs
- dbpedia: contains the dbpedia URIs
- class: contains classes not in wn30 nor in dbpedia

RDF Construction Strategy I

Create a blanknode _:x for each discourse referent (x0, x1, ...)

RDF Construction Strategy II

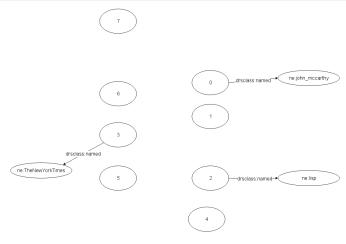

RDF Construction Strategy III

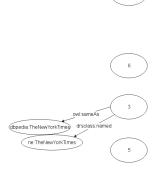

RDF Construction Strategy IV

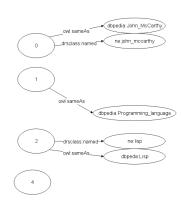

RDF Construction Strategy V

if NE and DBpedia URI exists create _:x owl:sameAs dbpedia:URI

RDF Construction Strategy VI

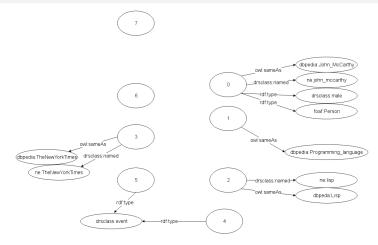

RDF Construction Strategy VII

```
via rdf:type assign closed classes (event, person, ...)
_:x rdf:type drsclass:CLOSEDCLASS
```

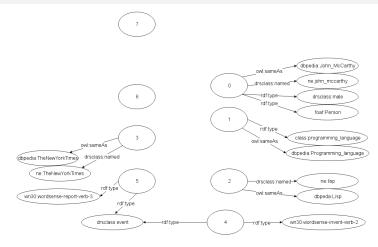

RDF Construction Strategy VIII

RDF Construction Strategy IX

```
via rdf:type assign open classes (die, programming_language, ...)
_:x rdf:type wn30:OPENCLASS, class:OPENCLASS
```

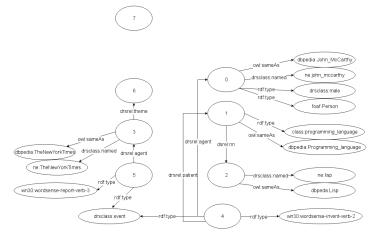

RDF Construction Strategy X

RDF Construction Strategy XI

```
create triples from binary relations (agent, theme, ...) _:x drsrel:RELATION _:y
```

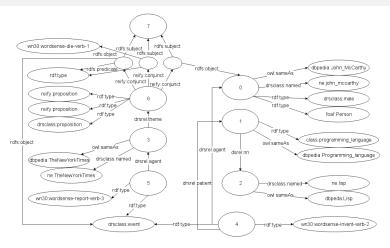

RDF Construction Strategy XII

RDF Construction Strategy XIII

recursive reification of embedded propositions (eg. by *report* or *says*)

RDF Construction Strategy XIV

Example: LODifier

RDF Construction: Output

```
_:var0x0 drsclass:named ne:john_mccarthy ;
         rdf:type drsclass:male . foaf:Person :
        owl:sameAs dbpedia:John_McCarthy_(computer_scientist) .
_:var0x1 rdf:type class:programming_language ;
         owl:sameAs dbpedia:Programming language .
:var0x2 drsrel:nn :var0x1 .
_:var0x2 drsclass:named ne:lisp ;
         owl:sameAs dbpedia:Lisp_(programming_language) .
:var0x3 drsclass:named ne:the new vork times :
        owl:sameAs dbpedia:The_New_York_Times .
_:var0x4 rdf:type drsclass:event , wn30:wordsense-invent-verb-2 .
         drsrel:agent _:var0x0 ; drsrel:patient _:var0x2 .
_:var0x5 rdf:type drsclass:event , wn30:wordsense-report-verb-3 ;
        drsrel:agent _:var0x3 ; drsrel:theme _:var0x6 .
_:var0x6 rdf:type drsclass:proposition , reify:proposition , reify:conjunction ;
        reifv:conjunct [ rdf:subject :var0x7 :
                          rdf:predicate rdf:type ;
                          rdf:object drsclass:event . ]
        reify:conjunct [ rdf:subject _:var0x7 ;
                          rdf:predicate rdf:type ;
                          rdf:object wn30:wordsense-die-verb-1 . ]
        reifv:conjunct [ rdf:subject :var0x7 :
                          rdf:predicate drsrel:agent ;
                          rdf:object _:var0x0 . ]
```

Conclusion

Experiments

Example: LODifier Experiments

Experiments

Method

- Evaluate by testing similarity of two given documents:
- the problem of deciding whether two randomly selected stories discuss the same news topic
- TDT-2 benchmark dataset: 84.000 news documents
- Extract 183 positive and 183 negative pairs (avg. 11.2 per topic)
- Calculate similarity and evaluate the system on the result

Experiments

Similarity measurements

- NEs identified by Wikifier and successfully disambiguated words in UKB
- 2 add NEs recognized by Boxer
- 3 add URIs of unrecognized words

Further add structural features: Measurement of the similarity of the RDF graphs of the two document

Experiments

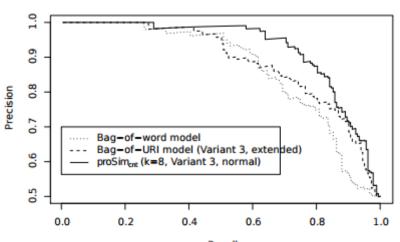

Accuracy

Table 1. Accuracy on Story Link Detection Task

| Model | normal | normal extended | |
|---|-----------|-----------------|--|
| Similarity measures without structural | knowledge | | |
| Random Baseline | 50.0 | _ | |
| Bag of Words | 63.0 | _ | |
| Bag of URIs (Variant 1) | 61.6 | 75.1 | |
| Bag of URIs (Variant 2) | 70.6 | 76.0 | |
| Bag of URIs (Variant 3) | 73.4 | 76.4 | |
| Similarity measures with structural kno | wledge | | |
| proSim _{cnt} (k=6, Variant 1) | 79.0 | 78.9 | |
| proSim _{cnt} (k=6, Variant 2) | 80.3 | 80.3 | |

What we didnt like

■ Redundant processes like NER

- Redundant processes like NER
- BlankNode Massacre

- Redundant processes like NER
- BlankNode Massacre
- confusing boxer relations not simplified for RDF (will be hard to search through)

- Redundant processes like NER
- BlankNode Massacre
- confusing boxer relations not simplified for RDF (will be hard to search through)
- Paper scratches only the surface of the system

- Redundant processes like NER
- BlankNode Massacre
- confusing boxer relations not simplified for RDF (will be hard to search through)
- Paper scratches only the surface of the system
- Some points are unclear / not even described

Weaknesses and Strengths of OIE

- trades precision for recall
- OIE > IE if no sepcial task/domain is defined
- theory independent
- relations may be redundant/overspecified/unintended
- restricted usability of results due to low precision

Future Opportunities

- better subsystems
 - Coreference Resolution
 - NER
 - Disambiguation
- improve semantic analysis
